

Increase your efficiency with electronic invoices

Electronic invoices has been around since the 80's, and still only 10% of all invoices are sent electronically. But the interest in electronic invoices is growing steadily – especially since more and more countries make laws that require all authorities to handle their incoming and outgoing invoices electronically.

Many companies have considered it complicated and expensive to send and receive electronic invoices, since clients' and suppliers' different computer systems sometimes have a hard time communicating with each other. But that doesn't have to be a problem anymore.

Our software platform, **ReadSoft DOCUMENTS**, can handle invoices in all sorts of formats (paper, fax, web, email) and supports different electronic standards, like XML. The possibilities are almost endless, and of course you can make use of them all at the same time!

But for now, let's focus on a procedure that is inexpensive and easy to get started with, and therefore often is how smaller suppliers start sending electronic invoices:

- The supplier simply sends an image of the invoice shown on screen.
- The client's receiving system then interprets this image and transfers it into the company's ERP system.
- Since the computer uses the same image as we see, it doesn't have to be converted into another format.

The receiver can handle the invoice just as a normal paper invoice, only without the tedious manual paperwork and scanning.

With ReadSoft DOCUMENTS you have everything you need to start sending and receiving electronic invoices – and the software is compatible with all ERP systems on the market. So why not make your invoice process more efficient today?
